Foreword

It is a great pleasure to publish the Hydrological Annual of Sri Lanka for the Water Year 2019/20 though delayed considerably due to unavoidable circumstances owing to the pandemic situation prevailed in the country. As the pioneer government institution responsible for collection and management of hydrological data necessary for Water Resources Management, Flood Management, Research and Academic needs of various institutions and professionals, Hydrology and Disaster Management Division (Hyg. & DM Division) of Irrigation Department (ID) continued this publication since 1960 with immense effort and devotion. Being the 61st volume of the series, this bulletin contains long term data and information as well as data collected during the Water Year 2019/20 (October 2019 to September 2020). During the recent years hydro-meteorological network of the country has been upgraded and modernized by introducing automated instruments and a monitoring system. Automated instruments have been installed at Manual Hydrological Stations while introducing some new stations at important locations. At present, there are 106 automated hydro-meteorological stations that are operated and maintained by the Hydrology & Disaster Management Division. However, manual monitoring has been continuously done, owing to the reliability of manual monitoring and the frequent maintenance issues and discontinuities appeared in the automated system.

This Bulletin contains two parts. Part I provides general information such as Terminology and Abbreviations Used, Conversion Factors, River Basin Map of Sri Lanka with catchment areas, and a list of principal Hydro-met Stations with their locations and drainage areas. Part II contains important hydro-meteorological data and information related to the current year and a comparison with long term data and information. I strongly believe that this section would be very useful for managers in the water sector and disaster management sector for making decisions. In addition, this part would be very useful for Academia and Researchers for further researches etc.

I would like to pay my appreciation to various personnel who contributed to make this publication a success. **Eng. Nihal Siriwardana (DGI), Eng. I.D.S. Samarasuriya (Addl. DGI (IP & D)**, all the members of the review panel, all of the staff of Hydrology and Disaster Management Division led by **Eng. Dr. S. Hemakanth (Chef Engineer), Eng. A.D.S. Iresh (Snr. IE), Eng. U.H.N.H. De Silva (ERE), Eng. Miss. G.W.A.S. Dilthara, Eng. Mr. S.A.D.S. Samarasinghe, Mr. K.A. Amarasiri (HDS)** and **Mr. M.H.G. Kamaljith (HFS)**. I would like to pay my special gratitude to all the staff of the Hydrology and Disaster Management Division who supported to collect all the data continuously even with the prevailed Covid – 19 pandemic situation. I apologize for not mentioning all the names who have devoted for the success of this publication as the space is limited.

Eng. S.P.C. Sugeeshwara

Director of Irrigation (Hydrology & Disaster Management)

2022-09-12

[Hydrological Annual – 2019/20]

Terminology and abbreviations used in the publication

| | | |
|------------------------------|---|--|
| Annual Flood Peak | - | Highest value of discharge for the year indicated by the hydrograph |
| Annual Runoff | - | The total volume of water measured at a particular point for the year. |
| Annual Yield | - | Annual yield is the volume of water available to the tank from its own catchment (without diversions) during the year. |
| Average Annual Rainfall | - | Arithmetic mean of annual rainfall values for the period of observation. |
| Average Annual Runoff | - | Arithmetic mean of annual run-off for the period of observation. |
| Evaporation | - | The transfer of water into the atmosphere from a free water surface. |
| Flood Hydrograph | - | A plot of discharge against time. |
| Maximum Flood Peak | - | Maximum observed flood peak during the period of observation. |
| MCM | - | Million Cubic Meter |
| NEM | - | North East Monsoon (October to March) |
| Potential Evapotranspiration | - | The evapotranspiration from vegetal cover and from soil surface when the root zone is saturated. |
| Rainfall Intensity | - | Cumulative depth of rainfall during a particular duration. |
| Specific Yield | - | Yield per unit Catchment Area |
| SWM | - | South West Monsoon (April to September) |
| HMIS | - | Hydro-Meteorological Information System |

1. General Information

1.1 Topography

Sri Lanka is a country which is lying within the tropical region (between $5^{\circ}55'E$ - $9^{\circ}51'E$, $79^{\circ}41'N$ - $81^{\circ}53'N$). The total land area is $65,610\text{ km}^2$. As shown in the topographic map Fig. 1, around 60% of the land area is located within a broad first peneplain, which the elevation ranges between 0~100 m above Mean Sea Level (MSL). Another peneplain rises to 500 m above MSL and covers around 30% of the land area. The other peneplain covers 10% of land area mostly situated in the central part of the Island, rises steeply to form a mountain range that reaches an elevation of 2,524 m above MSL.

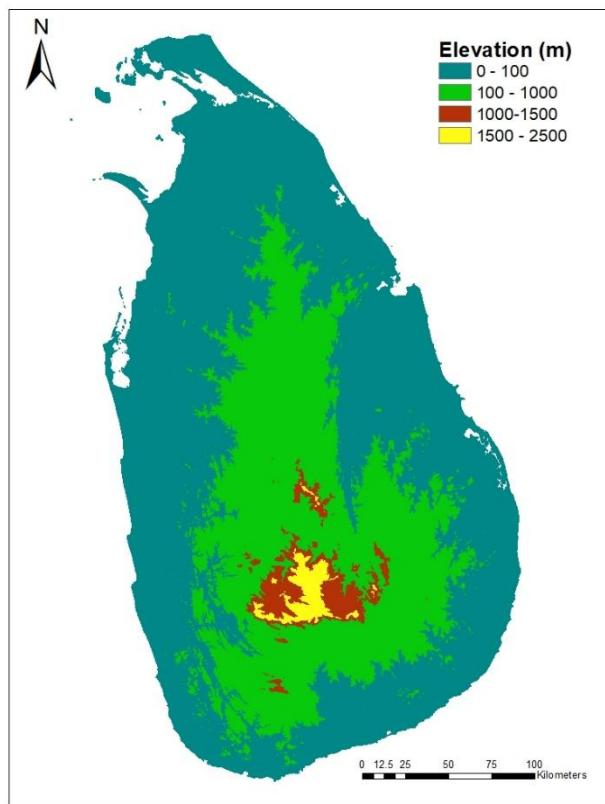

Fig. 1: Topography of Sri Lanka

1.2 Climate

The hydrologic cycle of this Island situated in the tropical region, is impacted mainly by the seasonally varying monsoon systems. The windward southern, western and central hill regions receive high rainfall during the South-West (SW) monsoon season, May to September, with rainfall ranging from 1000 to 4000 mm, while other regions on the leeward side experience less than 500 mm rainfall during the five months. On the other hand, during the North-East (NE)

monsoon season, December to February, the eastern and southeastern parts record a significant rainfall ranging from 500 to 1200 mm, while other parts record less rainfall. In addition to the above two main monsoons, another two more monsoon systems called Inter Monsoon-1 (IM-1) and Inter Monsoon-2 (IM-2) are influencing the weather system of the country. IM-1 is the warmest season, March to April, in Sri Lanka, and the whole country receives localized thunderstorms especially in the afternoon period. The South Western slopes and hilly regions get more rainfall of around 250 mm, while the rest of the country receives rainfall varying between 100 to 250 mm. On the other hand, IM-2 brings thunderstorms in the afternoon from October to November, influenced by depression and cyclones in the Bay of Bengal. The whole island experiences strong winds and a balanced distribution of rainfall. During this inter-monsoon the South Western slopes receive higher rainfall ranging between 700 to 1200 mm while other regions receive more than 400 mm, which leads to occasional flooding and landslides (Department of Meteorology-SL, 2020).

A spatially varying pattern of rainfall is observed, and it is influenced by the complex nature of the central highland's topography, as shown in Fig. 1. Therefore, the Department of Agriculture has demarcated the island into three main Argo climatic zones based on the spatial and temporal variability of annual rainfall, as shown in Fig. 2, wet zone (more than 2500 mm), intermediate zone (1750-2500 mm) and dry zone (less than 1750 mm) (Department of Meteorology-SL, 2020).

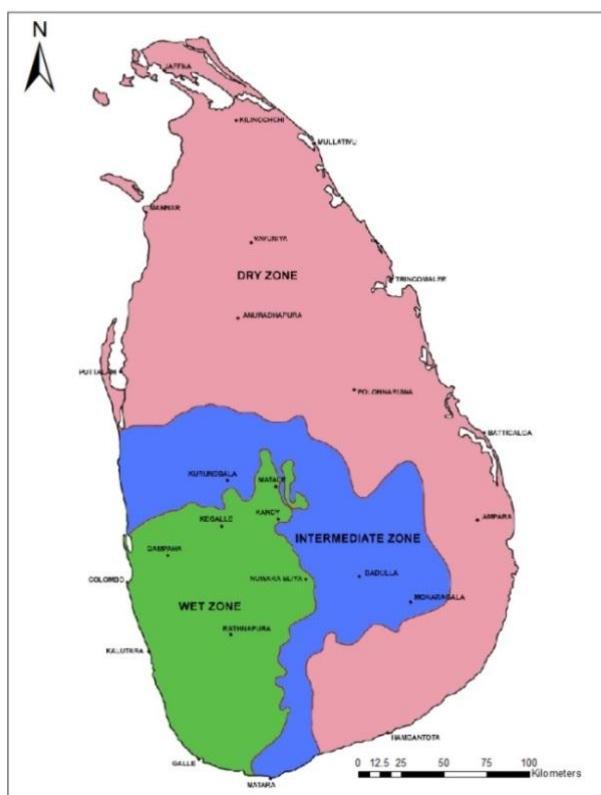

Fig. 2: Climate Zones of Sri Lanka

1.3 Water Resources of Sri Lanka

A total of 103 seasonal and perennial river systems, starting from the central part of the country, flow radially across various topographies and climatic zones before reaching the Indian Ocean surrounding the island. The river network of Sri Lanka is shown in Fig. 3, and the statics of catchment areas of rivers are given in Fig. 4. The majority of the rivers, 75 in total, have a catchment area less than 500 sq.km. Among them, 41 rivers drain less than 100 sq.km. There are 7 major rivers draining more than 2000 sq.km. The largest river basin is the Mahaweli (MRB), which drains 10,366 sq. km and covers 16% of the land area of the country. Other than this, there are four other river basins with a catchment area of over 2500 sq.km. Out of these four, three are located within the dry zone (Deduru Oya, Kala Oya, and Malwathu Oya) and connected with the MRB through trans-basin channels. The fourth river, the Kalu River, is located within the wet zone, and floods in this river create a major threat for the western region of Sri Lanka, mainly in Kalutara, and Ratnapura districts.

Though the Kalu, Kelani, Gin, and Nilwala river basins in the southern part of the country cover only 13% of the land area, almost 30% of the population live within these river basins. The dry-zone districts comprise 75% of the country (Amarasinghe 2010).

Note: There are land areas which are not accounted for any of above river basins such as Jaffna peninsula and micro catchments in coastal zone intervening between adjacent river basins.

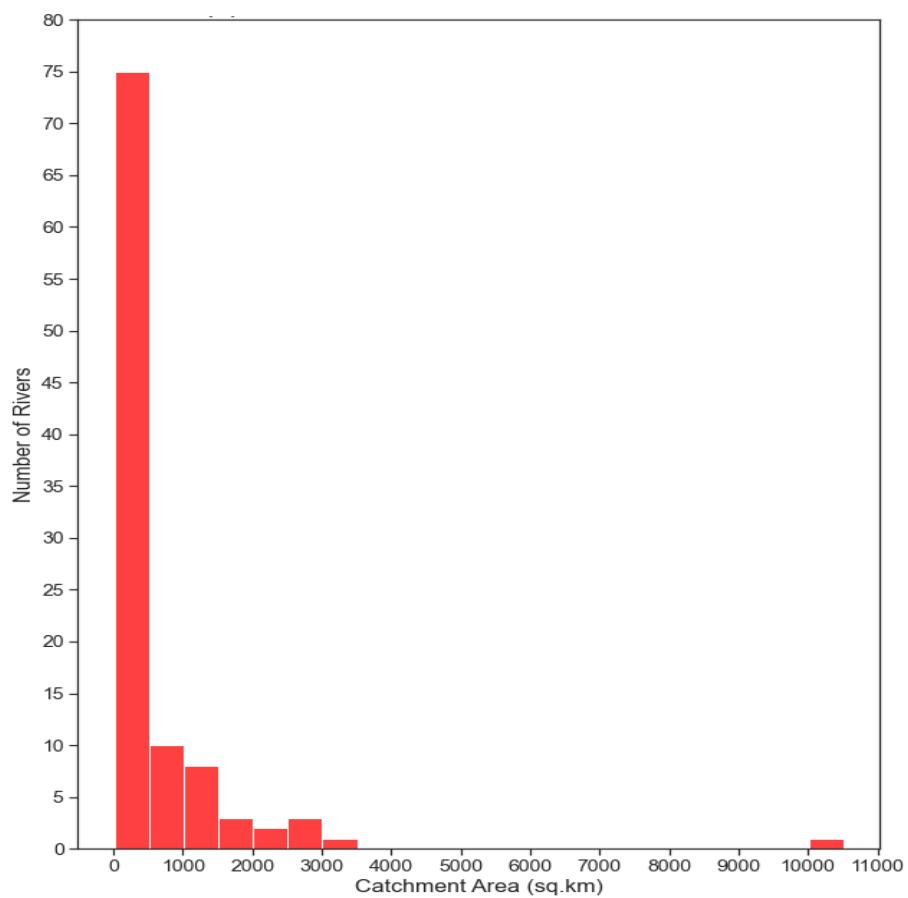

Fig. 4: Number of Rivers basis on Catchment Area

2. Hydrometric Stations - 2019/20

The Hydrology and Disaster Management Division maintains 40 main river gauging stations where a gauge reader is kept at a permanent site office each, to read the gauges manually in day and night so that the hourly gauge readings can be obtained. The list of those main hydrometric stations is given in Table 2 and the locations of them are shown in Fig. 5. In addition, 60 gauging stations have been established as peripheral stations, shown in Fig. 6. Further there are automated hydrometric stations under HMIS, shown in Fig. 7.

Table 2: Main River Gauging Stations

| No. | Name of Station | River Basin | Coordinate | | Drainage Area (Sq.km) |
|-----|------------------|---------------|-------------------------|------------------|-----------------------|
| | | | WGS 84 | SLD 99 | |
| 1 | Norwood | Kelani Ganga | (6°50'22"N, 80°36'42"E) | (182640, 181774) | 97 |

3. Hydro-Meteorological Data & Information

3.1 Monthly Rainfall

Monthly rainfall data at 36 stations maintained by Hydrology and Disaster Management Division of the Irrigation Department are given in Table 3. In addition, the data at 23 stations maintained by Department of Meteorology are included in Table 4. Both data were used to get the spatial variation over the island.

When considering temporal variation at each station, it can be seen that **Deraniyagala** has received the highest annual rainfall (4725mm) in the water year. But the average annual rainfall in past 30 years is highest in **Kithulgala** (4398mm). **Weraganthota** has received the highest total rainfall of North-East monsoon (1978mm) in the current water year while the highest of long-term average is also shown in the same location (1973mm). Likewise, the highest total rainfall of South-West monsoon in both water year (2893mm) and long-term average rainfall (2841mm) is shown in **Kithulgala**. Moreover, **Mannar** has received the lowest annual rainfall in both water year (1194mm) and long-term average rainfall (982mm). And **Calidonia** has received the lowest total rainfall of North-East monsoon (580mm) in 2019/20 while the lowest long-term average rainfall is shown in **Hambanthota** (627mm). When looking at the South-West monsoon, **Pothuvil** shows the minimum total rainfall of North-East monsoon (224mm) while **Mannar** shows the minimum of long-term average (226mm).

3.2.2 Spatial Variation of Rainfalls Over the Island

➤ NEM (North-East Monsoon) rainfall distribution

Overall the Dry Zone of the country has received a high rainfall compared to the long term average but the most of the parts in the Wet Zone and Intermediate Zone have received less than the long term average (Fig. 67 & Fig. 68).

➤ SWM (South-West Monsoon) rainfall distribution

Most of the area of the country has received a high rainfall compared to the long-term average while few stations in coastal area show an opposite scenario (Fig. 69 & Fig. 70).

➤ Annual rainfall distribution

The most of the parts in the country has received higher annual rainfall than the long-term average while few stations show an opposite scenario (Fig. 71 & Fig. 72).

3.4 Evaporation and Evapotranspiration

Pan Evaporation data which is collected from Irrigation Department, Department of Meteorology, Rubber Research Institute (Agalawathatha) and Sugar factories (Pelwatta, Sewanagala) were summarized in Table 6. Also Table 7 to Table 12 show monthly Evapotranspiration (ETo) calculated by Hydrology & Disaster Management Division using weather data obtained from Institutes mentioned above.

Out of 31 locations, **Kanthale** shows the highest Evaporation (1616mm) in 2019/20 water year while **Pelwatta** shows the highest (2105mm) in long term average for past 30 years. **Bandarawela** has recorded the minimum Evaporation (773mm) in current water year while **Agalawaththa** shows the minimum in long term average (864mm). When considering the available 6 locations, the maximum Evapotranspiration is shown in **Pelwatta** (1492mm) while the minimum is in **Padiyathalawa** (1205mm).

3.5 Stream Flow Data

River flow data and catchment rainfalls are summarized at 30 river gauging stations out of 40 main gauging stations maintained by the Hydrology and Disaster Management Division (Table 13).

As given in the table, the highest Annual Runoff in the current year (8776 MCM) and long-term average (6023 MCM) are shown at Kalu Ganga at **Putupaula**. The minimum Annual Runoff in the current year (64 MCM) and long-term average (46 MCM) are shown at Mee Oya at **Galgamuwa**.

The recorded highest peak discharge in the current year is 1912 Cumecs. However, the highest flow rate has been recorded historically at Manampitiya station in the year 1957 as 18,889 Cumecs, before the beginning of Mahaweli Development Project. The minimum peak discharge in the current year is recorded as 103 Cumecs. As per the long term records, the minimum peak flow rate has been recorded (before the current year) at Dunamale Station at Attanagalu Oya as 118 Cumecs.

3.6 Runoff - Rainfall Ratio

The percentage of runoff to the annual volume of catchment rainfall at 28 river gauging stations are given in Table 14.

Table 14: Runoff Rainfall Ratios - 2019/20

| No | Name of River Basin | Station | Annual Rainfall (mm) | Annual Runoff (mm) | Runoff / Rainfall ratio (%) | Long term average of Runoff/Rainfall ratio(%) |
|----|---------------------|----------------|----------------------|--------------------|-----------------------------|---|
| 1 | Kelani Ganga | Norwood | 2752 | 1993 | 72 | 50 |
| 2 | Kelani Ganga | Kithulgala | 3843 | 3051 | 79 | 82 |
| 3 | Kelani Ganga | Deraniyagala | 5812 | 3059 | 53 | 68 |
| 4 | Kelani Ganga | Holombuwa | 3448 | 1282 | 37 | 54 |
| 5 | Kelani Ganga | Glencourse | 4234 | 2780 | 66 | 69 |
| 6 | Kelani Ganga | Hanwella | 4119 | 2034 | 49 | 61 |
| 7 | Kalu Ganga | Rathnapura | 3863 | 1459 | 38 | 48 |
| 8 | Kalu Ganga | Ellagawa | 3912 | 2034 | 52 | 64 |
| 9 | Kalu Ganga | Millakanda | 4895 | 3179 | 65 | 66 |
| 10 | Kalu Ganga | Putupaula | 4187 | 3378 | 81 | 62 |
| 11 | Gin Ganga | Thawalama | 4255 | 2571 | 60 | 69 |
| 12 | Gin Ganga | Baddegama | 3923 | 2795 | 71 | 74 |
| 13 | Nilwala Ganga | Urawa | 2900 | 1441 | 50 | 45 |
| 14 | Nilwala Ganga | Pitabedda | 3361 | 1893 | 56 | 59 |
| 15 | Kirindi Oya | Wellawaya | 1853 | 982 | 53 | 37 |
| 16 | Kirindi Oya | Thanamalwila | 1781 | 376 | 21 | 20 |
| 17 | Menik Ganga | Katharagama | 1774 | 258 | 15 | 18 |
| 18 | Heda Oya | Siyambalanduwa | 2006 | 609 | 30 | 23 |
| 19 | Kumbukkan Oya | Nakkala | 1971 | 1361 | 69 | 58 |
| 20 | Maduru Oya | Padiyathalawa | 2460 | 922 | 37 | 41 |
| 21 | Mahaweli Ganga | Peradeniya | 3015 | 1839 | 61 | 46 |
| 22 | Mahaweli Ganga | Manampitiya | 3777 | 301 | 8 | 28 |
| 23 | Yan Oya | Horowpothana | 1654 | 227 | 14 | 18 |
| 24 | Malwathu Oya | Thanthirimale | 1527 | 358 | 23 | 12 |
| 25 | Mee Oya | Galgamuwa | 2091 | 214 | 10 | 6 |
| 26 | Maha Oya | Giriulla | 2825 | 487 | 17 | 33 |
| 27 | Maha Oya | Badalgama | 2772 | 1623 | 59 | 39 |
| 28 | Aththanagal Oya | Dunamale | 3430 | 2149 | 63 | 42 |

3.7 Monthly Discharges in Major Rivers

Monthly flow variation in major rivers at selected locations are given in Table 15 and Fig. 73 to Fig. 81 as follows. As shown in the figures, Monthly distribution in current water year is almost close to long-term average at given stations. All the figures show high flows in the month of October while Manampitiya shows high flows in December.

Table 15: Monthly Flow in Major Rivers

Upper line: Current year 2019/20

Lower line: Long term average

Units: MCM

| Station | Oct | Nov | Dec | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Total |
|-------------------------------|-----------------|----------------|-----------------|----------------|----------------|----------------|----------------|-----------------|----------------|----------------|----------------|-----------------|------------------|
| Kelani Ganga at Glencourse | 789.0 531.7 | 451.4 454.9 | 296.9 236.9 | 120.7 133.5 | 47.9 101.4 | 37.0 130.5 | 117.9 239.3 | 468.4 432.4 | 324.5 508.0 | 272.6 403.6 | 290.8 336.8 | 589.2 390.8 | 3806.4 3899.8 |
| Kalu Ganga at Rathnapura | 172.9 114.1 | 88.8 127.1 | 72.7 72.8 | 25.2 33.8 | 17.0 28.6 | 18.7 35.7 | 27.8 69.8 | 159.7 132.9 | 53.4 131.3 | 54.1 77.3 | 59.1 72.1 | 130.6 97.2 | 879.9 992.5 |
| Kalu Ganga at Ellagawa | 635.1 438.7 | 294.0 404.9 | 221.1 214.2 | 61.4 110.1 | 28.1 80.1 | 27.1 106.5 | 60.8 221.7 | 502.5 426.7 | 191.1 447.1 | 167.9 296.4 | 176.5 244.1 | 468.3 323.7 | 2833.9 3314.3 |
| Kalu Ganga at Putupaula | 1366.4 789.8 | 881.5 708.1 | 678.5 442.8 | 412.3 265.6 | 403.0 202.8 | 463.5 260.1 | 536.7 409.8 | 1056.4 740.0 | 663.2 765.1 | 641.0 501.8 | 563.7 408.7 | 1109.8 530.6 | 8776.0 6023.4 |
| Gin Ganga at Thawalama | 164.5 122.8 | 108.8 129.4 | 85.4 91.8 | 25.0 51.5 | 10.2 38.1 | 13.6 47.7 | 47.5 83.6 | 170.6 125.7 | 75.3 117.3 | 68.8 77.9 | 70.7 67.8 | 128.7 93.3 | 969.1 1046.8 |

3.8 Flood Overview – 2019/20

There is a high probability of flooding in river basins in Wet Zone of the country, during the South-West monsoon and during the second inter monsoon periods. In other words May, June, October and November months are critical for floods in those areas. Deduru oya, Maha oya, Attanagalu oya, Kelani, Kalu, Gin and Nilwala can be identified as most vulnerable river basins for floods in the said months.

The details of floods occurred during the water year 2019/20 are summarized in the Table 16 given below. In addition, flood hydrographs at Hydrological stations maintained by Irrigation Department are given by Fig. 82 to Fig. 87.

Table 16: Details of Maximum Flood Events Occurred During 2019/20

| River | Hydrometric Station | Date of Flood Peak | Observed Maximum Gauge Height (m) | Observed Maximum Discharge (m ³ /s) | Flood Volume (MCM) | Catchment Rainfall (mm) | Runoff Rainfall Ratio of the flood (%) | Inundated DS Divisions | Return Period (yr) |
|----------------|---------------------|--------------------|-----------------------------------|--|--------------------|-------------------------|--|--|--------------------|
| Kalu Ganga | Ratnapura | 19.05.2020 | 8.67 | 402.9 | 80 | 285 | 47 | Ratnapura Elapatha Kiriella Kuruvita | 5 |
| | Millakanda | 28.05.2020 | 7.20 | 404.0 | 252 | 527 | 61 | Ayagama Bulathsinhala Dodangoda Horana Millaniya Palindanuwara Kaluthara | 3 |
| Gin Ganga | Thawalama | 19.05.2020 | 6.67 | 393.3 | 25 | 176 | 38 | Neluwa Thawalama | 2 |
| Attanagalu Oya | Dunamale | 22.10.2019 | 5.25 | 103.8 | 52 | 458 | 74 | Gampaha Aththanagalla Minuvangoda Ja Ela | 2 |
| Maha Oya | Badalgama | 16.05.2020 | 6.75 | 985.8 | 90 | 203 | 33 | Pannala Divulapitiya Dankotuwa Katana | 3 |
| | Giriulla | 16.05.2020 | 7.03 | 915.5 | 63 | 199 | 26 | Pannala Mirigama Divulapitiya | 3 |
